Subject Overview:	The subject will consist of three components: Firstly, a lecture series to guide the student on the formulations available, the indications and contra-indications for their use and the current clinical protocols employed in the use of these formulations. Lecture topics covered will include anti-microbial, anti-viral, anti-inflammatory and anti-glaucoma medications; Secondly, a series of CAL practical sessions in which the student will be encouraged to apply knowledge gained in the lectures to a theoretical series of clinical situations; Thirdly, a series of seminars on the therapeutic management of ocular disease in which the students will prepare and present their management strategies in response to a variety of case histories and the supervising clinician will discuss current best-practice management associated with these cases and highlight issues associated with incorrect diagnosis. By the end of this subject the student will be required to have demonstrated a sound theoretical knowledge of the range and application of specific groups of therapeutic drugs in the management of eye disease.											

<b>Objectives:</b>	The purpose of this subject is to provide students with a sound knowledge of the range of prescription drugs used in the management of eye disease, along with the appropriate protocols and precautions necessary for their safe and effective clinical use.
<b>Assessment:</b>	A 10-minute oral presentation on a case report during the semester (20%); computer-aided learning assignments due during the semester (20%); a 2-hour written examination in the examination period (60%). An attendance rate of at least 80% is a hurdle requirement for each student for the Ophthalmology Seminar Series.
