<b>Subject Overview:</b>	<p>The subject provides an introduction to the unified picture of elementary particles and atomic nuclei - how the elementary quarks combine to form strongly interacting particles, and how two of these, the proton and neutron combine to form atomic nuclei; how quarks and their composites interact with the leptons and with each other; how we study these systems experimentally; and the exciting unanswered questions in this field of physics.</p> <p>Topics covered will be selected from: quarks and leptons; strong, electromagnetic and weak interactions; symmetries and conservation laws; structure, models and properties of hadrons; structure, models and properties of nuclei; scattering and decay processes; accelerators; detectors; fission and fusion reactors; applications of nuclear and particle physics techniques; and other topics in sub-atomic physics of contemporary interest.</p>						
<b>Objectives:</b>	<p>Students completing this subject should be able to:</p> <ul style="list-style-type: none"> <li># explain the unified picture of quarks and leptons, hadrons, and atomic nuclei, and their basic properties and interactions; and</li> <li># solve and analyse problems in these areas by applying simple quantum mechanical reasoning.</li> </ul>						

	In addition, students should enhance their ability to plan effective work schedules and manage their time to meet the deadlines for submission of assessable work and prepare for tests and examinations.
<b>Assessment:</b>	Test of 1 hour (5%) and two assignments equivalent to 1500 words each during the semester (7.5% each); a 3-hour written examination in the examination period (80%).
