Subject Overview:	Health and illness are multifactorially determined by interactions between biological, social and psychological factors. In this subject students will be introduced to psychological factors that are relevant to the physical and mental health of populations including health beliefs and behaviours, health locus of control, mood, personality and interpersonal skills. Models of health promotion, health education, disease prevention, illness causation, recovery from serious illness and treatment compliance involve psychological factors and will be examined using specific examples. The first aim of this course is to increase the skills of critical evaluation of conceptualizations of psychological determinants of physical and mental health. The second aim is to increase knowledge of the inclusion of psychological factors in population health research, through appropriate conceptualisation and use of psychometric measures.
Objectives:	On completion of this subject students will be able to: <ul style="list-style-type: none"> # Understand psychological factors relevant to physical and mental health; # Appraise the evidence for psychological factors in health promotion and health education strategies critically; # Appraise the evidence for psychological causation of illness critically; # Understand the range of psychological responses to adverse experiences, including medical conditions and their treatment; # Conceptualise and describe psychological factors relevant to population health research; # Understand the various methods of quantifying psychological factors in research
