<b>Subject Overview:</b>	This subject provides an introduction to electrodynamics and a wide range of applications including communications, superconductors, plasmas, novel materials, photonics and astrophysics. Topics include: revision of Maxwell's equations, strategies for solving boundary value problems for static and time-varying fields, electromagnetic fields in materials (including dielectrics, magnetic materials, conductors, plasmas and metamaterials), electromagnetic waves, derivation of geometric optics from Maxwell's equations, guided waves, relativistic electrodynamics and the covariant formulation of electrodynamics, radiation by antennas and accelerating charged particles.
<b>Objectives:</b>	Students completing this subject should be able to: <ul style="list-style-type: none"> <li># explain classical electrodynamics based on Maxwell's equations including its formulation in covariant form;</li> <li># solve problems involving the calculation of fields, the motion of charged particles and the production of electromagnetic waves; and</li> <li># analyse the solution of these problems in the context of a range of applications.</li> </ul>
<b>Assessment:</b>	Two assignments each equivalent to 1500 words during the semester (10% each), and a 3-hour written examination in the examination period (80%).
