

CHEM20020 Chemistry: Structure and Properties

Credit Points:	12.50																					
Level:	2 (Undergraduate)																					
Dates & Locations:	This subject is not offered in 2014. Lectures, tutorials and seminars.																					
Time Commitment:	Contact Hours: 3 x one hour lectures per week; 1 x one hour tutorial per week; 3 x one hour seminars during the semester. Total 51 hours Total Time Commitment: Estimated total time commitment of 120 hours

Core Participation Requirements:	<p>For the purposes of considering request for Reasonable Adjustments under the Disability Standards for Education (Cwth 2005), and Students Experiencing Academic Disadvantage Policy, academic requirements for this subject are articulated in the Subject Description, Subject Objectives, Generic Skills and Assessment Requirements of this entry. The University is dedicated to provide support to those with special requirements. Further details on the disability support scheme can be found at the Disability Liaison website:</p>

Subject Overview:	This subject covers key concepts related to the stereochemical and electronic properties of molecules and the methods central to their study. Important elements of the subject include																					

	the spectroscopic characterisation and quantification of materials by a range of spectroscopic techniques, molecular orbital techniques and the application of approaches based on molecular symmetry and group theory to the understanding of molecular properties, stereo-selective reactions, bonding and spectroscopy. These topics have applications to advanced materials, light emitting polymers, chemical analysis and catalysis in biological and industrial systems.
Learning Outcomes:	<p>Upon completion of this subject students should;</p> <ul style="list-style-type: none"> # be able to classify molecules according to their symmetry and to relate their physical properties (e.g. dipole moment, isomerism) to the molecular symmetry; # have a basic knowledge of the basis and application of spectroscopic techniques that are conducted in the presence (NMR, EPR) or absence (IR, Raman, UV-Vis.) of an applied magnetic field; # be able to apply molecular orbital theory to simple homo- and heteronuclear diatomic molecules and polyatomic molecules; # be able to apply simple Huckel approaches to arrays of atoms having orbitals of pi symmetry; # be able to identify systems that are aromatic or antiaromatic in character and to have a knowledge of their basic reactions; # be able to describe the changes in bonding that occur to small molecules (e.g. CO) on binding to a transition metal and to be able to apply these concepts to the catalysis of reactions of those species.
Assessment:	Five short tests each of approximately 90 minutes duration conducted on-line using the learning management system (LMS) for a total of 20%; the tests will run in weeks 2, 4, 7, 10 and 12 and the mark for this component of the assessment will be based on the average of the four highest marks with each test contributing equally to this component of the assessment. A three hour examination at the end of the semester will contribute 80% to the final grade.
