<b>Subject Overview:</b>	The subject provides a capstone experience for students majoring in Genetics. It involves lectures and practical exercises which demonstrate advanced principles and techniques of genetic analysis from classical and population genetics to modern molecular technology. An emphasis is placed on student participation in experimental design and data analysis. Tutorials will be used to illustrate modern aspects of Genetics by the in-depth consideration of current publications in the field.
<b>Learning Outcomes:</b>	Upon completion of the subject, students should have: understood the application of genetic principles and different experimental designs in classical, molecular and genetic analysis; appreciated the advantages and disadvantages of these different designs; developed a detailed understanding of the techniques employed in experimental designs; experienced the use of particular laboratory techniques and analytical approaches in different areas of genetics; become proficient in the analysis and interpretation of data derived from their own experimentation and that of others; the use of bioinformatics to analyse complex genetic data; gained experience in the written and oral presentation of scientific data; and developed an appreciation of the scientific literature and how experimental results in Genetics are presented in publications.
<b>Assessment:</b>	Written assignments/problem solving tasks equivalent to a total of approximately 1000 words (15%); practical reports equivalent to a total of approximately 3000 words (30%) (The due dates for the written assignments/problem solving tasks and practical reports are distributed across the semester); Written report on a journal paper due late in the semester (20%) 20-minute oral presentation once during the semester (5%); a 2-hour written examination in the examination period (30%)
