<b>Subject Overview:</b>	Algebra has a long history of important applications throughout mathematics, science and engineering, and is also studied for its intrinsic beauty. In this subject we study the algebraic laws satisfied by familiar objects such as integers, polynomials and matrices. This abstraction simplifies and unifies our understanding of these structures and enables us to apply our results to interesting new cases. Students will gain further experience with abstract algebraic concepts and methods. General structural results are proved and algorithms developed to determine the invariants they describe.						
<b>Learning Outcomes:</b>	<p>On completion of this subject, students should</p> <p>Have an understanding of:</p> <ul style="list-style-type: none"> <li># rings, factorization in rings, principal ideal domains, Euclidean domains;</li> <li># modules, free modules, structure theorem for finitely generated modules over a principal ideal domain;</li> <li># fields, field extensions, finite fields, Galois extensions; splitting fields and the Galois correspondence.</li> </ul> <p>Be able to:</p> <ul style="list-style-type: none"> <li># prove results about rings, modules and fields;</li> <li># apply the Euclidean algorithm in a general context, including polynomials;</li> </ul>						

	<ul style="list-style-type: none"> <li># calculate the Jordan Normal form of a matrix;</li> <li># describe the Galois correspondence for the splitting field of a polynomial.</li> </ul>
<b>Assessment:</b>	Two or three written assignments due at regular intervals during semester amounting to a total of up to 50 pages (20%), and a 3-hour written examination in the examination period (80%).
